Family-Centered Practices, Parent Engagement, and Parent and Family Functioning

Carl J. Dunst, Ph.D.
Orelena Hawks Puckett Institute
Asheville, North Carolina

Presentation prepared for the Head Start Advisory Committee Meeting of Parent, Family, and Community Engagement, Washington, DC, June 7-8, 2011.
Overview

• Illustrate the manner in which family-centered practices, parent self-efficacy beliefs, and practitioner responsiveness to parents’ requests are related to family involvement in their children’s learning and parenting confidence and confidence

• Summarize findings from both primary studies and meta-analyses of the relationships between family-centered practices and parent and child behavior and functioning

• Share lessons learned from both research and practice on family-practitioner relationships and parent engagement
## Types of Child and Parenting Programs

Definition of Family-Centered Practices

Family-centered practices treat families with dignity and respect; provide family members with information needed to make informed decisions and choices; actively involve families in obtaining resources and supports; and practitioner responsiveness and flexibility to family requests and desires.
Two Types of Family-Centered Practices

Our research has consistently found that there are two discernable kinds of practices that “fall into” distinct subcategories of family-centered practices:

- Relational help-giving practices
- Participatory help-giving practices
Relational Family-Centered Practices

• Relational practices include behavior typically associated with effective clinical practice, including, but not limited to, compassion, active and reflective listening, empathy, and effective communication.

• Relational practices also include practitioner beliefs and attitudes about family and cultural strengths, values, and attitudes, and practitioner sensitivity to these beliefs and values as part of intervention practices.
Participatory Family-Centered Practices

• Participatory practices include behavior that actively involve family members in (a) informed choice and decision making and (b) using existing strengths and abilities as well as developing new capabilities needed to obtain resources, supports, advice, etc.

• Participatory practices also include practitioner responsiveness to and flexibility in how help is provided to children and their families
Meta-Analyses of Family-Centered Practices Research

Assess the extent to and manner in which the use of family-centered practices are directly and indirectly related to (a) parent involvement in their children’s learning and early education, (b) parenting confidence and competence, (c) parent and family well-being, and (d) child behavior and development mediated by parents’ self-efficacy beliefs.
## Major Practice and Research Measures

Practice-Based Research Syntheses of Family-Centered Practices

• Meta-analysis of 52 studies conducted by more than 20 researchers and research teams in seven countries\textsuperscript{a,b}

• Meta-analysis of 18 studies conducted in one early childhood intervention and family support program\textsuperscript{c}

Influences of Family-Systems Intervention Practices on Parent-Child Interactions and Child Development

Studies: Eight studies that included measures allowing us to trace the effects of capacity-building family-centered practices and family-systems intervention practices on parent-child interactions and child development.

Sample: 910 preschoolers and their parents involved in different kinds of preschool and family support programs.

Predictions: The influences of family-centered and family-systems intervention practices on parent-child interactions and child development would be indirect and mediated by both self-efficacy beliefs and parent well-being.

Lessons Learned from Family-Centered Research and Practice

• Family-centered practices provide a foundation for strengthening parent-professional relationships and engaging families in early childhood and family support programs
• Family involvement in their children’s learning and education needs to be judged as meaningful (worthwhile) to sustain parent engagement
• Responsiveness to parents’ informational, instrumental, and other types of needs is one factor contributing to parents’ judgments of meaningful involvement
• Self-efficacy appraisals are one determinant of the likelihood of parent involvement and engagement having positive parent and child benefits
